

Synoppy V2

Ship ideas to working prototypes — in minutes

No setup. No boilerplate. No friction.

THE PROBLEM

Ideas don't fail. Execution speed does.

Most brilliant ideas never reach a prototype stage because the friction is too high. The path from concept to testable product is littered with obstacles that kill momentum before you can validate anything.

Setup takes days

Configuring environments, installing dependencies, and wrestling with boilerplate code consumes valuable time that should be spent on innovation.

Tools are fragmented

Design tools, code editors, hosting platforms, and testing frameworks live in different ecosystems, forcing constant context switching.

Momentum dies before feedback arrives

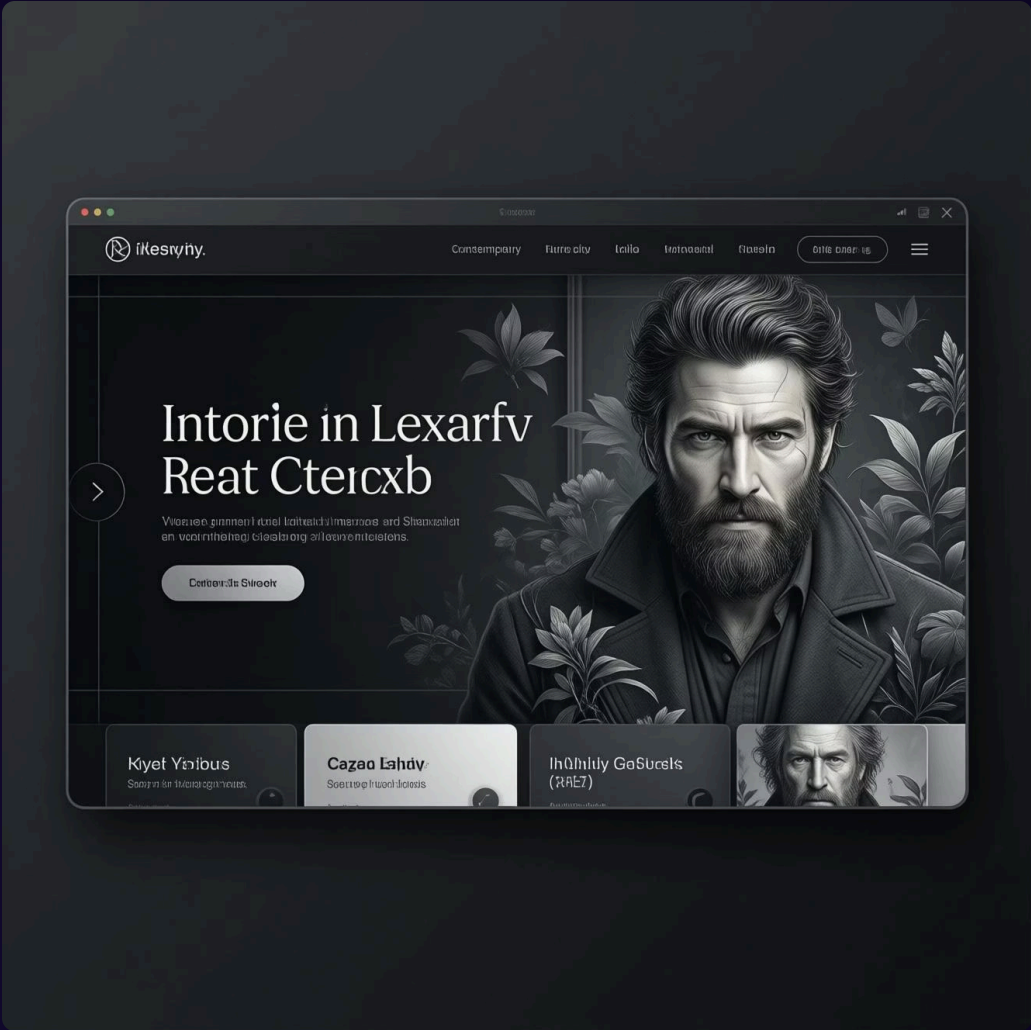

By the time you have something to show, the excitement has faded and market conditions may have shifted.

❏ If you can't test an idea fast, you can't learn what works.

A prototype shouldn't be a mockup

Traditional prototypes are static artifacts—beautiful screens that don't respond, clickable wireframes that don't process data, or design files that require complete rebuilds to become functional.

Synoppy redefines what a prototype means in the modern development workflow.

Clickable

Every button works, every link navigates, every interaction responds

Runnable

Real code executing real logic with actual data flow

Editable

Modify, extend, and customize without starting over

Shareable

Send a link and let others experience your vision instantly

It's not a design. It's working software.

Synoppy ships ideas to working prototypes

The gap between imagination and implementation has never been smaller. Describe your idea in plain, conversational language—no technical jargon, no architecture decisions, no framework debates. Synoppy understands your intent, plans the structure, and delivers a fully functional prototype you can click through, test, and share.

Think

Articulate your concept

Test

Interact with working software

Iterate

Refine based on real feedback

How it works

01

Describe your idea

Write what you want to build in natural language—as if explaining to a colleague

02

Synoppy understands intent

AI analyzes requirements, identifies features, and plans architecture automatically

03

Prototype is generated

Complete, functional application built with modern frameworks and best practices

04

You interact & refine

Click, test, explore—experience your idea as real software, not screenshots

05

Share or continue building

Distribute the link for feedback or keep iterating toward your MVP

 No manual setup, configuration, or deployment required at any stage.

Start with a real idea

The power of Synoppy lies in its simplicity. You don't need to know React from Vue, PostgreSQL from MongoDB, or REST from GraphQL. Just describe what you want to achieve.

"I want a simple web app to track daily expenses with login and charts."

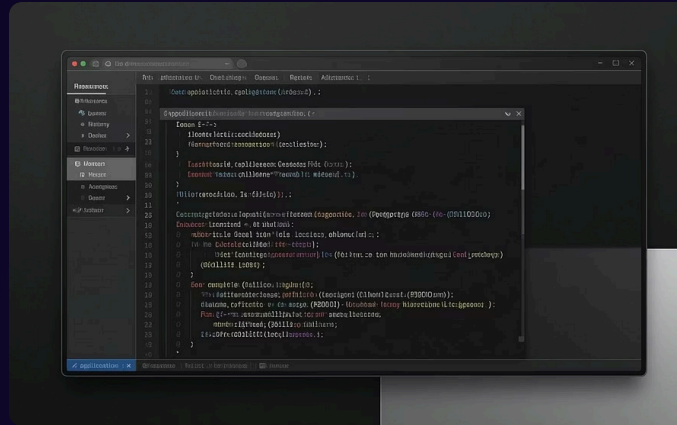

That's it. No technical specifications. No stack decisions. No wireframes. Just the core idea expressed in everyday language.

What you get

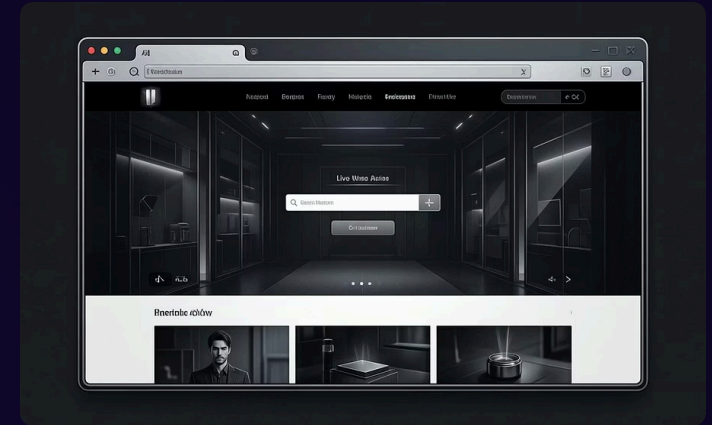

Real UI

Polished interface that looks and feels professional

Functional logic

Backend systems processing data, handling auth, managing state

Live preview

Instantly accessible URL to test in any browser

A working prototype

Complete application with all core features implemented and functional

Editable project

Full source code access to customize, extend, or rebuild as needed

Not a demo. Not screenshots. Real, deployable software.

Refine the prototype, not the prompt

Traditional AI tools force you to restart with better prompts. Synoppy remembers context and builds on what exists. Your prototype evolves naturally through conversation, just like working with a developer who understands your project history.

"Add monthly analytics dashboard"

"Make the entire interface mobile-friendly"

"Simplify the onboarding to three steps"

Each refinement builds on the previous version. Synoppy rebuilds with full context, understanding what you've already built and what you're trying to achieve. No need to re-explain. No risk of losing progress.

 AUDIENCE

Built for fast builders

Founders validating ideas

Test market assumptions with real prototypes before investing months in development. Get customer feedback on actual software, not pitch decks.

Indie hackers shipping MVPs

Launch products faster by eliminating setup overhead. Focus on customer discovery and iteration instead of infrastructure.

Students testing concepts

Bring classroom ideas to life without semester-long projects. Experiment with entrepreneurship without needing a computer science degree.

Teams exploring directions

Rapidly prototype alternative approaches to see what resonates. Make strategic decisions based on working examples, not abstract discussions.

 If speed matters more than perfection, if learning beats planning, if testing ideas is better than debating them—Synoppy fits your workflow.

This isn't a copilot

Traditional AI Copilots

- Help you write code faster
- Autocomplete functions
- Suggest implementations
- Require you to know what to build

Question: *"How do I build this?"*

Synoppy V2

- Helps you test ideas faster
- Generates complete prototypes
- Delivers working software
- Understands what you want to achieve

Question: **"Does this work?"**

Copilots accelerate coding. **Synoppy accelerates learning.**

Clarity, fast.

Validate before investing months

Ensure your concept has real potential and market fit early in the development cycle.

Get feedback early

Share working software with stakeholders and users to gather crucial insights when changes are easiest to implement.

Kill bad ideas quickly

Identify flaws or lack of demand in concepts without wasting significant time and resources on dead ends.

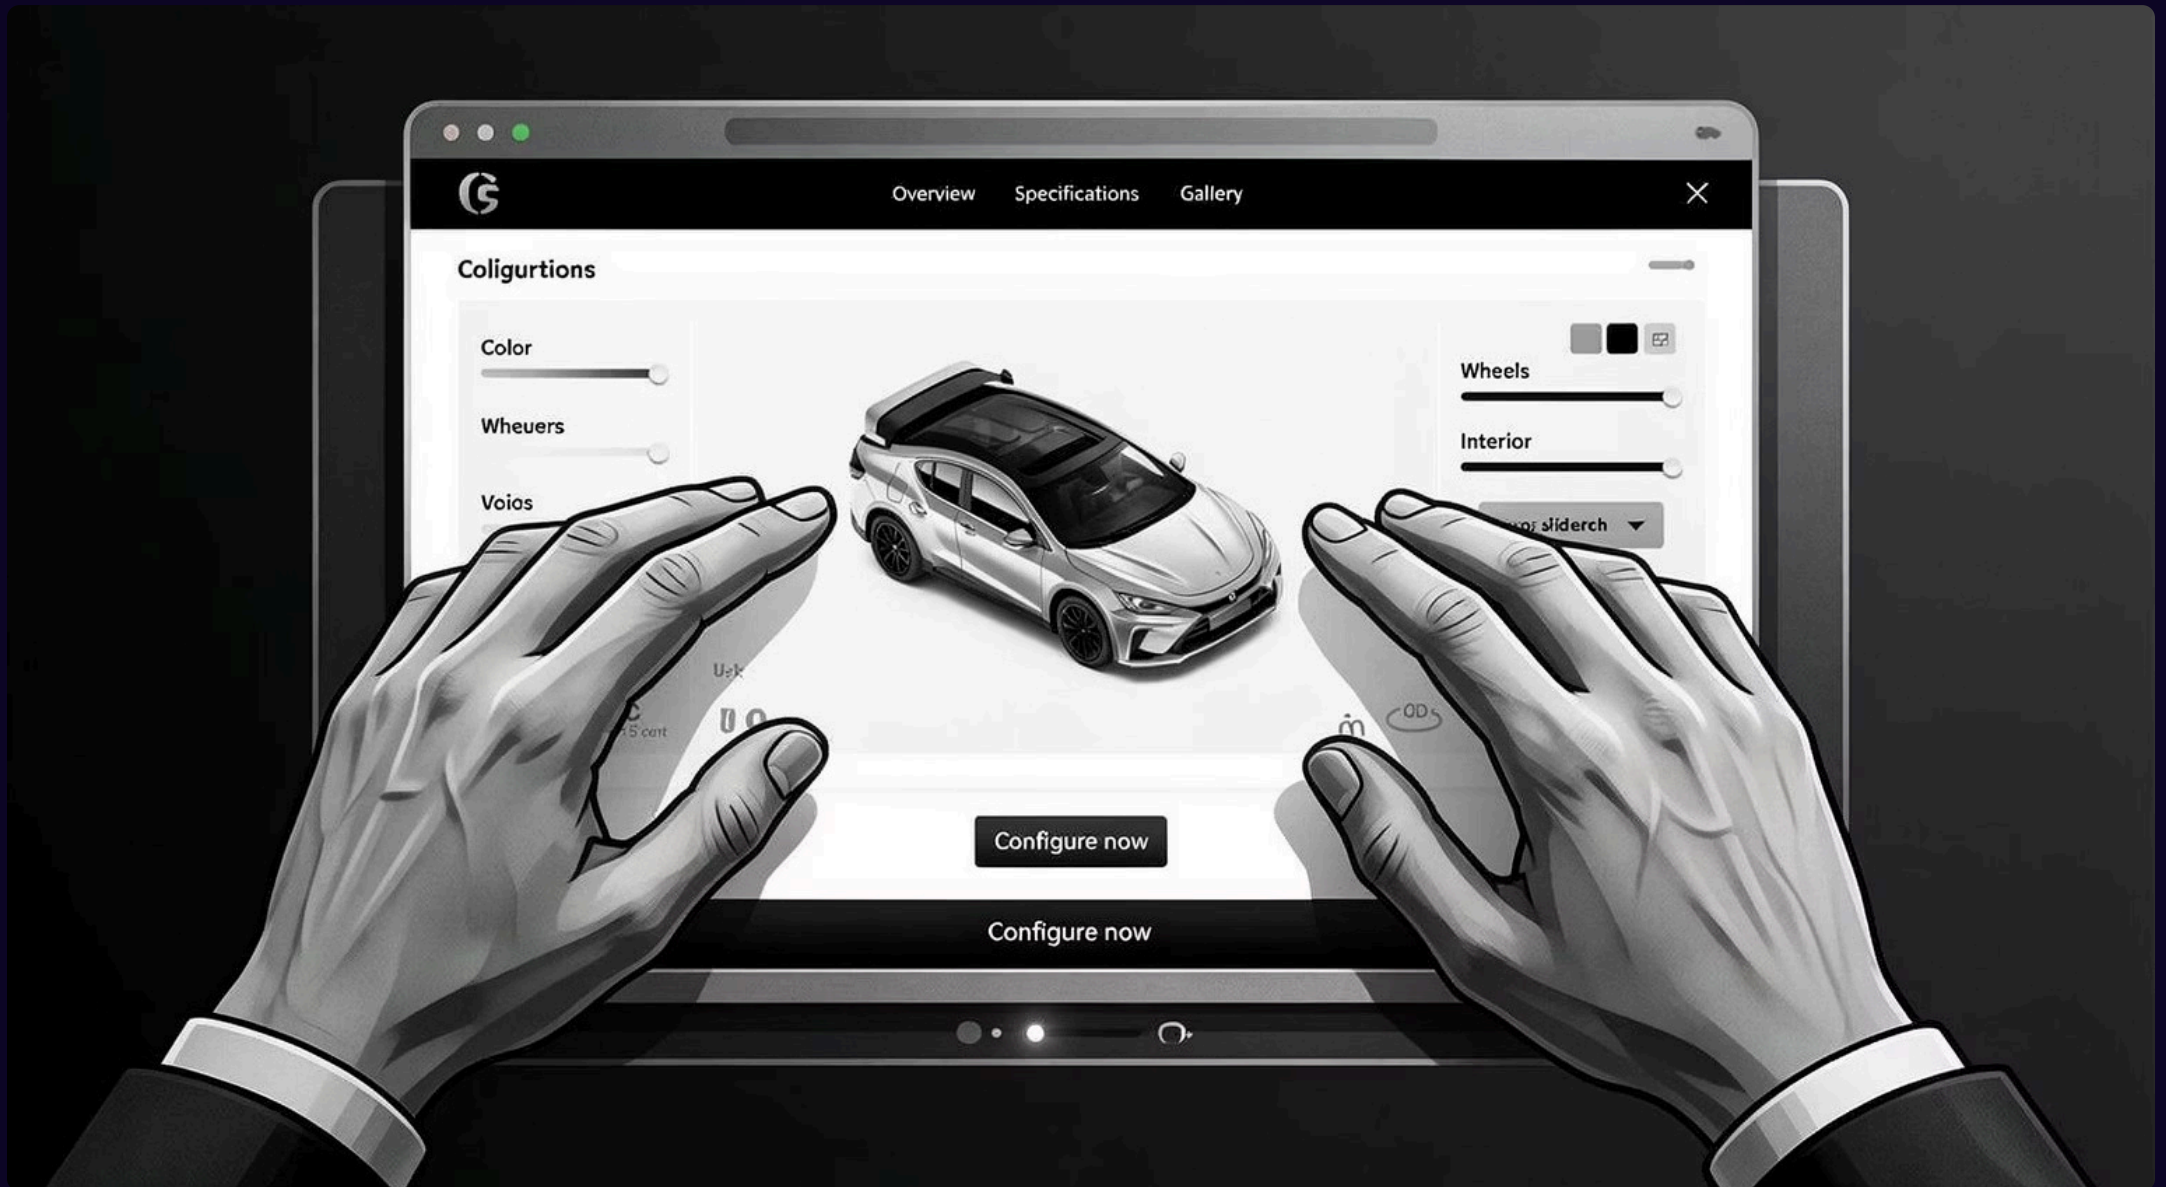

Double down on good ones

Accelerate development of promising ideas that have demonstrated viability and positive user engagement.

Prototypes are how ideas survive.

Ship your next idea today.

Stop dreaming, start building. Your next breakthrough is just a few clicks away.
